**CLASSIFICATION OF
GEOSYNCHRONOUS OBJECTS**

ISSUE 13

by

T. Flohrer, R. Choc, and B. Bastida

Produced with the DISCOS Database

February 2011

ESOC
Robert-Bosch-Str. 5, 64293 Darmstadt, Germany

Abstract

This is a status report on geosynchronous objects as of the end of 2010.

Based on orbital data in ESA's DISCOS database and on orbital data provided by KIAM the situation near the geostationary ring (here defined as orbits with mean motion between 0.9 and 1.1 revolutions per day, eccentricity smaller than 0.2 and inclination below 30 deg) is analysed. From 1202 objects for which orbital data are available, 397 are controlled inside their longitude slots, 622 are drifting above, below or through GEO, 172 are in a libration orbit and 11 whose status could not be determined. Furthermore, there are 72 uncontrolled objects without orbital data (of which 66 have not been catalogued). Thus the total number of known objects in the geostationary region is 1274.

During 2010 at least sixteen spacecraft reached end-of-life. Eleven of them were reorbited following the IADC recommendations, of which one spacecraft was reorbited with a perigee of 241 km - it is not yet clear if it will enter the 200-km protected zone around GEO or not -, four spacecraft were reorbited too low and at least one spacecraft did not or could not make any reorbiting manoeuvre at all and is now librating inside the geostationary ring.

If you detect any error or if you have any comment or question please contact

1 Introduction

All objects near the geostationary ring which are catalogued in ESA's DISCOS Database (Database and Information System Characterising Objects in Space) are listed in this document. The main purpose is to classify all these objects according to different categories. Indeed, six different types of categories are defined:

- C1: objects under longitude and inclination control (E-W as well as N-S control) - the longitude is nearly constant and the inclination is smaller than 0.3 degrees,
- C2: objects under longitude control (only E-W control) - the longitude is nearly constant but the inclination is higher than 0.3 degrees,
- D: objects in a drift orbit,
- L1: objects in a libration orbit around the Eastern stable point (longitude 75 degrees East),
- L2: objects in a libration orbit around the Western stable point (longitude 105 degrees West),
- L3: objects in a libration orbit around both stable points.

All objects are selected from ESA's DISCOS Database according to the following criteria:

- eccentricity smaller than 0.2
- mean motion between 0.9 and 1.1 revolution per sidereal day, corresponding approximately to a semi-major axis between 42164-2500 and 42164+3150 km.
- inclination lower than 30 degrees

The basic source of information are the NASA Two-Line Elements (TLE). The DISCOS Database is updated at regular intervals by ESOC's Space Debris Office (on average 1 TLE per week and per object is stored). The accuracy of TLE is limited. At the geostationary altitude, only objects larger than about 1 m in size are tracked on a regular basis. The main information given by this catalogue is the classification of the objects according to their type of motion. It should be noted that also some of the derived parameters like libration period and libration amplitude may sometimes have a limited accuracy. For further information about the method of classification please refer to *Classification of geostationary objects*, (Ref. 1).

This document contains three tables:

- Table 1 contains objects with recently updated orbital elements. They are ordered according to their type of motion and some orbital information is given.
- Table 2 contains objects for which there were no TLEs available during the last 6 months. The orbital data is provided by Vladimir Agapov, Keldysh Institute for Applied Mathematics, Moscow (KIAM).
- Table 3 contains all the objects the status of which cannot be determined by our software. The main reason for the difficulty to classify an object is that there are not enough TLEs available or that the status has recently changed (satellite newly launched or recently manoeuvred).

In order to find a specific object in one of the three tables, there is a list of all objects in ascending order of their COSPAR identification in Chapter 2.

2 List of geosynchronous objects

All the catalogued objects near the geostationary ring are listed here. They are ordered according to their COSPAR designation. The status of these objects (controlled, drifting, libration), the table in which they are classified and a reference number are also given.

Column 1: COSPAR designation.

Column 2: Object's common name.

Column 3: Number of the Table in which the object is classified:

- Table 1: objects with updated TLEs.
- Table 2: objects with orbital data by KIAM or without any orbital data.
- Table 3: status is indeterminate.

Column 4: The status of the object:

- C1: objects under longitude and inclination control (E-W as well as N-S control),
- C2: objects under longitude control (only E-W control),
- C: objects under control (source: KIAM - no TLEs available).
- D: objects in a drift orbit,
- L1: objects in a libration orbit around the Eastern stable point (longitude 75 degrees East),
- L2: objects in a libration orbit around the Western stable point (longitude 105 degrees West),
- L3: objects in a libration orbit around both stable points.
- Ind: the status could not be determined.
- U: uncontrolled objects (source: KIAM - no TLEs available).

Column 5: A reference number to find the object in its table.

Please note, that objects in tables 4.7 (Unidentified objects) and 4.9 (Uncontrolled uncatalogued objects) are not included in this list.

3 Table 1: Objects with Two-Line-Element data

This table contains all objects with recently updated Two-Line-Elements.

The objects are ordered according to the following criteria:

1. Status C1, then according to the ascending order of longitude of station keeping.
2. Status C2, then according to the ascending order of longitude of station keeping.
3. Status D, then according to the ascending order of the mean drift rate (which is equivalent to the decreasing order of the mean semi-major axis).
4. Status L1, then according to the ascending order of the libration period (which is equivalent to the ascending order of the libration magnitude).
5. Status L2, then according to the ascending order of the libration period (which is equivalent to the ascending order of the libration magnitude).
6. Status L3, then according to the ascending order of the libration period (which is equivalent to the ascending order of the libration magnitude).

The following symbols are used:

- nn: is the reference number.
- COSPAR: is the COSPAR identification.
- Name: is the object's common name.
- Date: is the epoch of the last available TLE.
- $\bar{\lambda}$: is the mean longitude of the satellite (in degrees).
- $\bar{\dot{\lambda}}$: is the mean drift of the satellite (in deg/days).
- $\overline{\Delta a}$: is the difference between the satellite's mean semi-major axis and the geostationary semi-major axis (in km).
- $\overline{\Delta r_p}$: is the perigee mean deviation from the geostationary altitude (in km).
- $\overline{\Delta r_a}$: is the apogee mean deviation from the geostationary altitude (in km).
- P_{lib} : is the libration period (in days).
- $\Delta\lambda$: is the libration magnitude (in degrees): $\Delta\lambda = \lambda_{max} - \lambda_{min}$
- λ_{min} : is the minimum longitude of the libration (in degrees).
- λ_{max} : is the maximum longitude of the libration (in degrees).
- N_{ly} : is the number of Two-Line Elements stored during the last 52 weeks.
- N_{tot} : is the total number of Two-Line Elements available for this object.
- MJD1950: is the Modified Julian Date (number of days since 01-Jan-1950) corresponding to "Date"
- a, e, i, Ω , ω and λ are the last values of the satellite's semi-major axis (in km), eccentricity, inclination (in degrees), right-ascension of the ascending node (in degrees), perigee argument (in degrees) and longitude (in degrees).

3.1 Satellites under longitude and inclination control (E-W and N-S control)

In the case where the satellite is under longitude and inclination control, the following data are given:

C1.nn	COSPAR	NAME					N_{Iy}	N_{tot}
	Date	$\bar{\lambda}$						
	MJD	a	e	i	Ω	ω	λ	

For explanation, see definition at the beginning of Chapter 3 on page 29.

3.2 Satellites under longitude control (only E-W control)

In the case where the satellite is only under longitude control, the following data are given:

C2.nn	COSPAR	NAME					
	Date	$\bar{\lambda}$				N_{Iy}	N_{tot}
	MJD	a	e	i	Ω	ω	λ

For explanation, see definition at the beginning of Chapter 3 on page 29.

3.3 Objects in a drift orbit

In the case where the object is in a drift orbit, the following data are given:

D.nn	COSPAR	NAME					
	Date	$\bar{\lambda}$	$\bar{\Delta a}$	$\bar{\Delta r_p}$	$\bar{\Delta r_a}$	N_{Iy}	N_{tot}
	MJD	a	e	i	Ω	ω	λ

For explanation, see definition at the beginning of Chapter 3 on page 29.

3.4 Objects in a libration orbit around the Eastern stable point

In the case where the object is in a libration orbit around the Eastern stable point (longitude 75 E), the following data are given:

L1.nn	COSPAR	NAME					
	Date	P_{lib}	$\Delta\lambda$	λ_{min}	λ_{max}	N_{Ly}	N_{tot}
	MJD	a	e	i	Ω	ω	λ

For explanation, see definition at the beginning of Chapter 3 on page 29.

3.5 Objects in a libration orbit around the Western stable point

In the case where the object is in a libration orbit around the Western stable point (longitude 105 W), the following data are given:

L2.nn	COSPAR	NAME					
	Date	P_{lib}	$\Delta\lambda$	λ_{min}	λ_{max}	N_{ly}	N_{tot}
	MJD	a	e	i	Ω	ω	λ

For explanation, see definition at the beginning of Chapter 3 on page 29.

3.6 Objects in a libration orbit around both stable points

In the case where the object is in a libration orbit around both stable points, the following data are given:

L3.nn	COSPAR	NAME					
	Date	P_{lib}	$\Delta\lambda$	λ_{min}	λ_{max}	N_{ly}	N_{tot}
	MJD	a	e	i	Ω	ω	λ

For explanation, see definition at the beginning of Chapter 3 on page 29.

It is important to note that this category is special and only a smaller number of objects is concerned. It is a borderline case, just between a libration around one stable point and a drift around the Earth. Thus, some perturbations which could be neglected in the other cases have a strong influence here. The main consequence is that this category is more sensitive to errors in the measurements than the others and the libration period may have a low accuracy.

The longitude history of these objects is plotted in Figures 1 to 5.

4 Table 2: Objects without Two-Line-Element data

This table contains all objects for which the TLEs were not updated during the last six months or for which no TLEs are available at all.

They are ordered according to the following criteria:

1. Status C1, then according to the ascending order of longitude of station keeping.
2. Status C2, then according to the ascending order of longitude of station keeping.
3. Status C, then according to the COSPAR identifier.
4. Status D, then according to the ascending order of the semi-major axis.
5. Status L1, then according to the ascending order of the longitude.
6. Status L2, then according to the ascending order of the longitude.
7. Status L3, then according to the ascending order of the longitude.
8. Status UI (unidentified objects), then according to their UI number.
9. Status U (uncontrolled objects), then according to the COSPAR identifier.
10. Status UU (uncontrolled uncatalogued objects), then according to the COSPAR identifier.

The objects listed in chapter 4.1, 4.2 and 4.4 to 4.8 were observed repeatedly by ground based telescopes. They were listed in the previous issues as 'Unidentified objects'. During the year 2010 most of them were correlated to a launch thanks to the excellent work of satellite analysts and amateur observers. But for the objects in chapter 4.8 their origin is not yet determined with the required reliability.

Orbits were established by processing of optical measurements and propagation to Jan 1, 2011 00:00:00 UTC except a few cases when the orbit was propagated to UTC midnight closest to the last obtained measurement. For most of the orbits this time point is within the orbit determination time interval but for some of them it is outside due to visibility constraints of the participating optical facilities.

The numerical integration model used in the data processing is taking into account the Earth gravity field (16x16, EGM-96), the Moon and the Sun gravity (DE-405 ephemeris) and solar radiation pressure (diffuse Lamberthian sphere model).

All objects are usually relatively bright as a rule (brighter than 15th magnitude at favorable phase angles) and have no significant short term variations in brightness. Though there are a few exceptions.

The listed orbits are produced from measurements obtained in 2010. They are a joint product of the wide cooperation of organizations including:

- Center on collection, processing and analysis of information on space debris at the Keldysh Institute of Applied Mathematics of the Russian Academy of Sciences (KIAM RAS, Moscow, Russia),
- International scientific observation facilities network (ISON) coordinated by KIAM RAS and including the following observatories:
 - Crimean Astrophysical Observatory (Nauchny and Simeiz facilities, Ukraine),
 - Ussuriysk Astrophysical Observatory of the Far East branch of the RAS (Gornotayozhnoye, Russia),
 - Terskol observatory of the Institute for Astronomy of the RAS (INASAN) (North Caucasus, Russia),

- Ulugbek Astronomical Observatory (Kitab facility, Uzbekistan),
- Observation facilities operated by "NPP "Proekt-tekhnika", JSC:
 - * Blagoveshchensk (Amur region, Russia),
 - * Milkovo (Kamchatka peninsula, Russia),
 - * Artem (Primorsky region, Russia),
- Andrushivka Observatory (Ukraine),
- National Astronomical Observatory (Abastumani, Georgia),
- National observatory of Bolivia (Tarija),
- Observation facility of the PGU (Tiraspol),
- Observatory of the Institute for Astrophysics of Tajikistan (Gissar),
- Odessa State University Astronomical Observatory (Mayaki, Ukraine),
- Central (Pulkovo) Astronomical Observatory of the RAS (St.Petersburg, Russia),
- Astronomical Institute of the University of Bern, partner of ISON, operating the Zimmerwald observatory (Switzerland) and, for space debris observation, the ESA 1 m telescope at the optical ground station (OGS), Izaña, Tenerife, Spain.
- Joint Italian-Russian telescope FIRST at Collepardo observation facility (Italy)

The following data are given:

TYPE	COSPAR	NAME				
UInnn	YYYYMMDD	HH:MM:SS.SS	Tosc	Hp	Ha	Longit
	Inclin	RAAN	AoP	SemiAxis	Eccentr	M

where:

- TYPE - type of orbital motion performed by the object as determined from 5 years observations:
 - C1 - maintains longitude and near-zero inclination,
 - C2 - maintains longitude only,
 - C3 - maintains longitude and a non-zero inclination,
 - C4 - maintains a drift orbit inside the GEO protected zone,
 - D1 - drifts along GEO under natural perturbations influence only,
 - D2 - drifts along GEO under natural perturbations and accelerations produced by on-board energy sources,
 - L1 - librates around Eastern stable point,
 - L2 - librates around Western stable point,
 - L3 - librates around both stable points
- COSPAR - the COSPAR identification
- NAME - the object's common name
- UInnn - number of object (used by KIAM before identification)
- YYYYMMDD HHMMSS.SS - date and time of ascending node crossing, UTC
- Tosc - osculating period, min
- Hp - perigee height, km
- Ha - apogee height, km

- Longit - geodetic longitude at given ascending node, degrees East
- Incln - inclination, degrees
- RAAN - right ascension of ascending node, degrees
- AoP - argument of perigee, degrees
- SemiAxis - semimajor axis, km
- Eccentr - eccentricity
- M - mean anomaly, degrees

The osculating orbital elements are given in the standard Earth equator J2000 reference frame.

4.1 Satellites under longitude and inclination control (E-W and N-S control)

In the case where the satellite is under longitude and inclination control, the following data are given:

C1.nm	COSPAR	NAME				
UInnn	YYYYMMDD	HH:MM:SS.SS	Tosc	Hp	Ha	Longit
	Inclin	RAAN	AoP	SemiAxis	Eccentr	M

For explanation, see definition at the beginning of Chapter 4 on page 104.

4.3 Objects in a drift orbit

In the case where the object is in a drift orbit, the following data are given:

Dn.nn	COSPAR	NAME				
UInnn	YYYYMMDD	HH:MM:SS.SS	Tosc	Hp	Ha	Longit
	Inclin	RAAN	AoP	SemiAxis	Eccentr	M

For explanation, see definition at the beginning of Chapter 4 on page 104.

4.8 Uncontrolled objects

In this list there are objects for which no orbital elements are available and which are no longer controlled according to information provided by KIAM. In this case, the following data are given:

U.nn	COSPAR	NAME	TYPE
U . 1	75118D	OPS 3165 debris (Telescope aperture suncover)	Debris
U . 2	76059D	OPS 2112 debris (Telescope aperture suncover)	Debris
U . 3	79053D	OPS 7484 debris (Telescope aperture suncover)	Debris
U . 4	89046E	USA 39 debris (Telescope aperture suncover)	Debris
U . 5	90097D	AKM ?	Rocket Body
U . 6	01033E	USA 159 debris (Telescope aperture suncover)	Debris

For the following objects several years old TLEs are available:

D	COSPAR	NAME					
	Date	$\bar{\lambda}$	$\bar{\Delta a}$	$\overline{\Delta r_p}$	$\overline{\Delta r_a}$	N_{Iy}	N_{tot}
	MJD	a	e	i	Ω	ω	λ

For explanation, see definition at the beginning of Chapter 3 on page 29.

4.9 Uncontrolled uncatalogued objects

In this list there are objects which are known to have been released from satellites in GEO, but which have not been catalogued by USSTRATCOM. The list of objects has been compiled by Vladimir Agapov (KIAM) and Jonathan McDowell (Harvard-Smithsonian Center for Astrophysics). The following data have been provided by KIAM for these objects:

UU.nn	COSPAR	NAME	TYPE
UU. 1	71039	OPS 3811 debris (Telescope aperture suncover)	Debris
UU. 2	72010	OPS 1570 debris (Telescope aperture suncover)	Debris

UU. 66	07054	USA 197 debris (Telescope aperture suncover)	Debris

5 Table 3: objects of indeterminate status

This table contains all the objects the status of which cannot be determined by our software. The main reason for the difficulty to classify an object is that there are not enough TLEs available or that the status has recently changed (satellite newly launched or recently manoeuvred). Indeed, at least 5 TLEs with the same status are needed to determine the category in which the object falls. Some bad measurements can also cause the failure to classify an object correctly. The objects are ordered according to their COSPAR designation. The following information is available:

Ind.nn	COSPAR	NAME					
	Date					N_{Iy}	N_{tot}
	MJD	a	e	i	Ω	ω	λ

The longitude histories of the first four objects in this category are plotted in Figures 6 to 7.

Figure 6: Longitude history of the objects of indeterminate status

Figure 7: Longitude history of the objects of indeterminate status

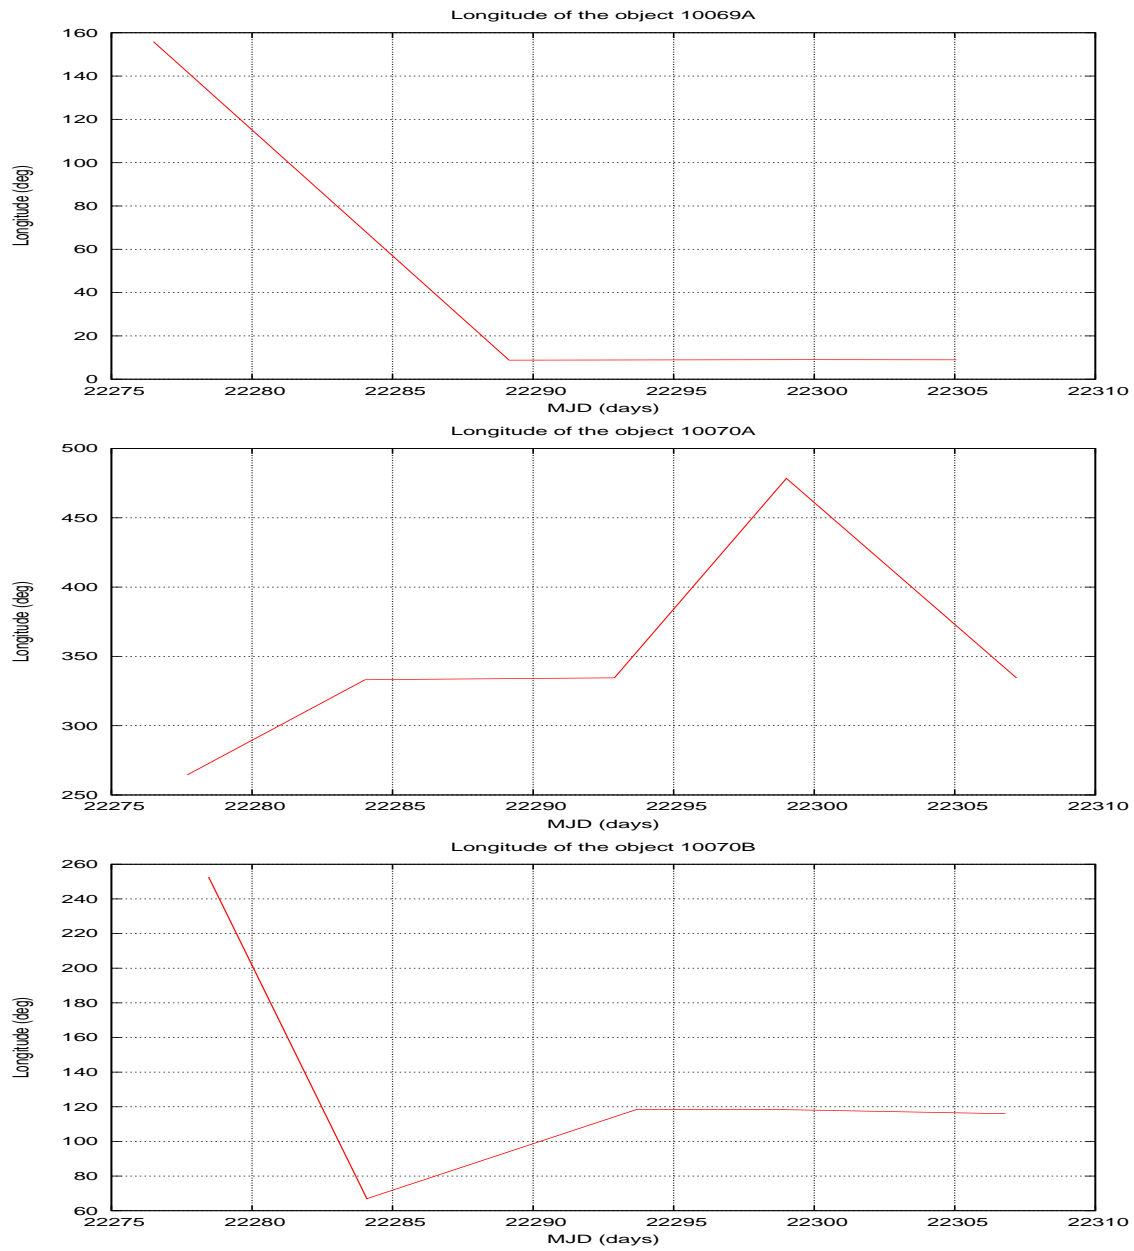

Figure 8: Longitude history of the objects of indeterminate status

6 Figures

The previous tables are now illustrated by seven graphs. They give a global view of the situation in the geostationary orbit and the distribution of the objects in each category.

- Figure 9: Number of objects in each category
- Figure 10: Number of objects under control, in drift orbit or in libration orbit according to the launch year
- Figure 11: Distribution of the longitude of the satellites (with TLEs) under control
- Figure 12: Distribution and altitude range of the objects (with TLEs) in drift orbit
- Figure 13: Zoom in the distribution and altitude range of the objects (with TLEs) in drift orbit
- Figure 14: Distribution of the perigee mean deviation from the geostationary altitude for the objects (with TLEs) in drift orbit
- Figure 15: Number of objects (with TLEs) librating through a given longitude

Classification of geosynchronous objects

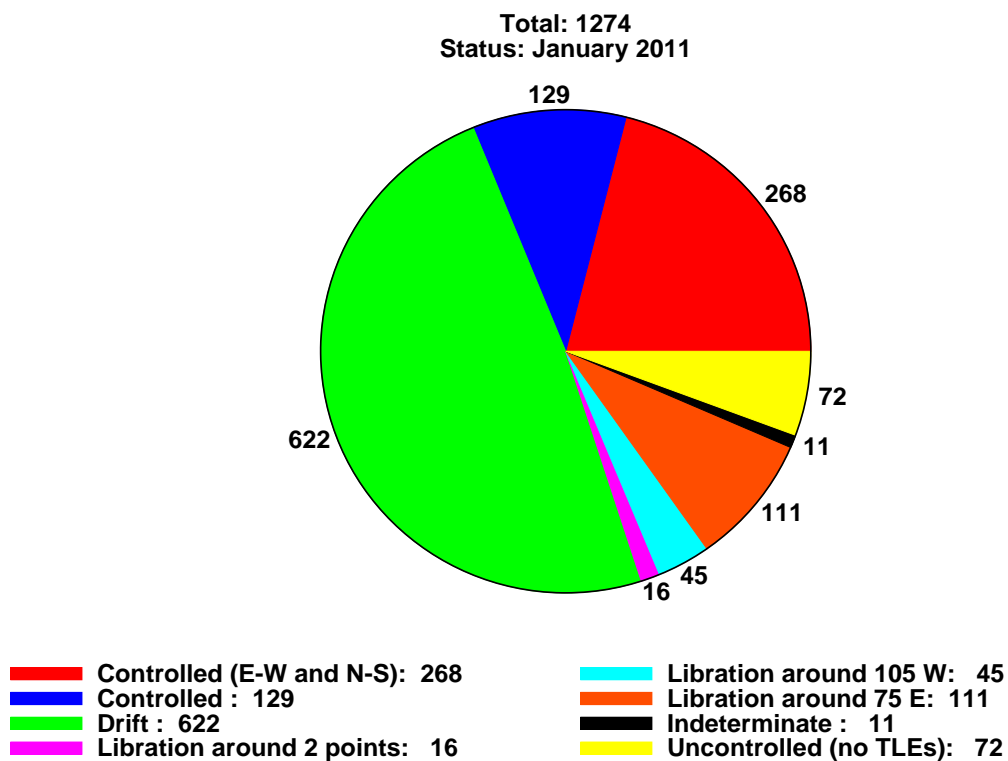

Figure 9: Number of objects in each category

Classification of geosynchronous objects

(Objects with recently updated TLEs)
Status: January 2011

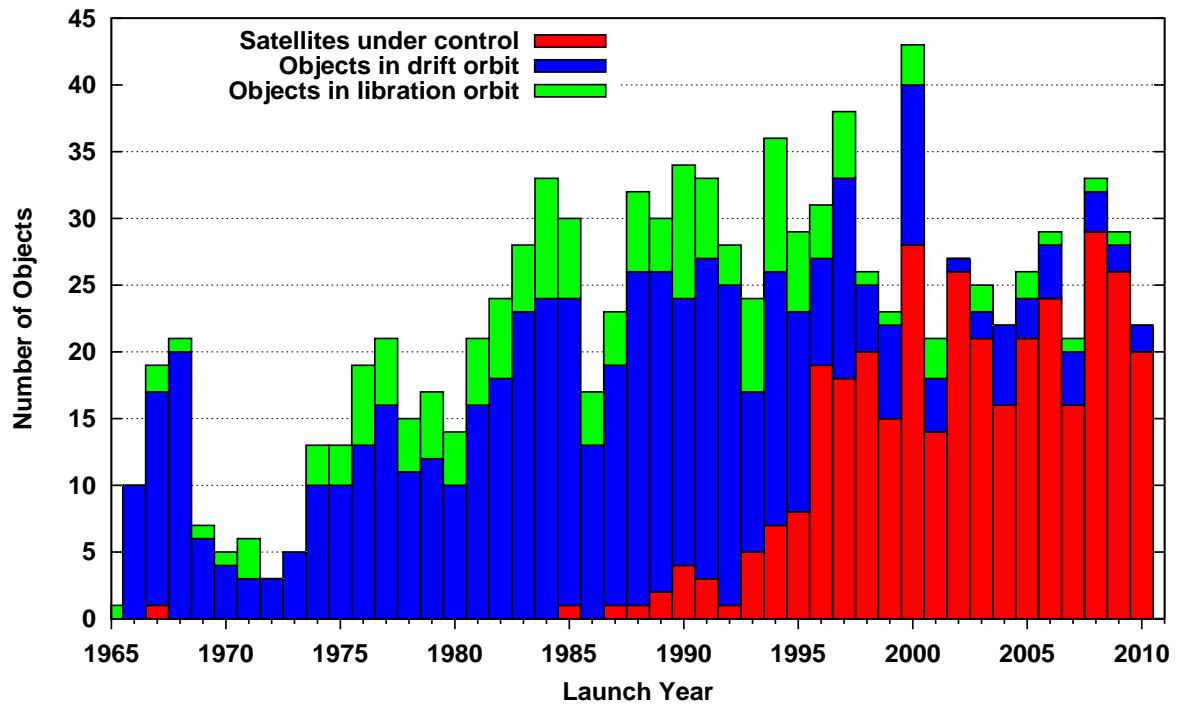

Figure 10: Number of objects in each category according to the launch year.

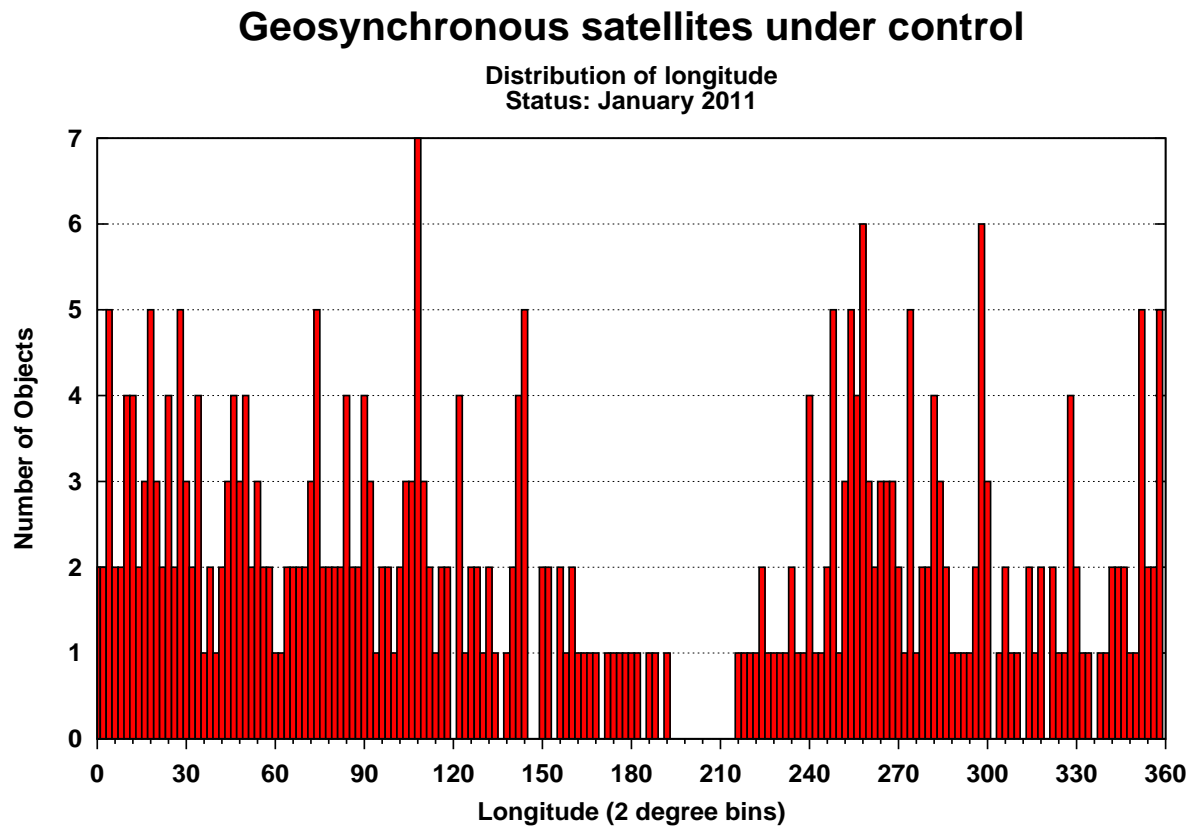

Figure 11: Distribution of the longitude of the 350 satellites under control (with updated TLEs).

Figure 12: Distribution and altitude range of the objects in drift orbit.

This figure illustrates the distribution of the objects in drift orbit. Each vertical line represents one object.

The horizontal axis gives the semi-major axis mean deviation from the geostationary altitude, which is inversely proportional to the mean drift rate of the object.

The vertical axis gives the perigee and apogee mean deviation from the geostationary altitude. The altitude of the object librates between these two values. One can see that if the eccentricity is large, the object can go through the geostationary altitude.

Figure 13: Zoom in the distribution and altitude range of the objects in drift orbit.

This figure is a zoom of the previous figure. This area is important because, according to the IADC recommendations, a satellite should be reorbited at its end-of-life to a graveyard orbit with a perigee altitude which is about 300 km above the GEO ring.

Figure 14: Distribution of the perigee mean deviation from the geostationary altitude.

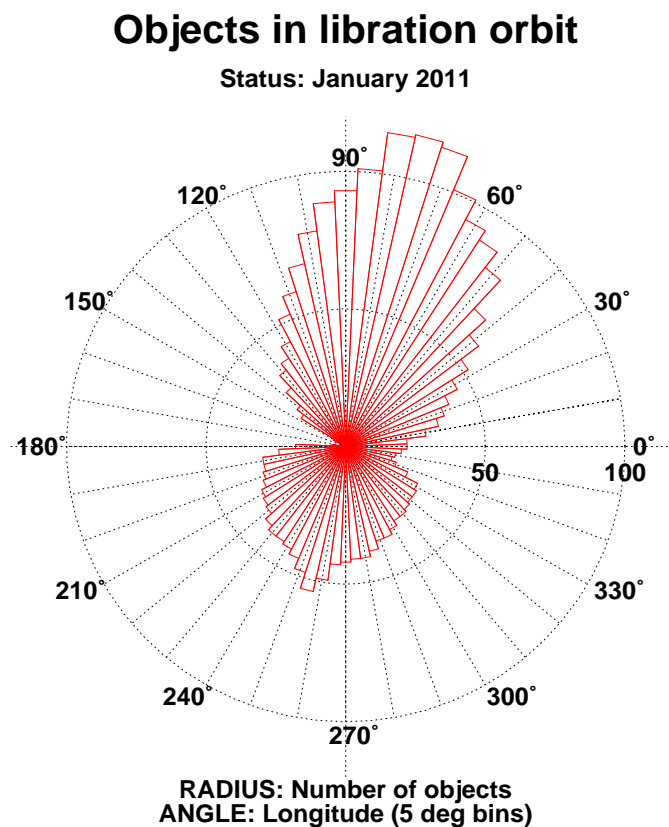

Figure 15: Distribution of the objects in libration orbit in 5-deg bins of geographic longitude (objects with updated TLEs only).

This figure illustrates the distribution of the objects in a libration orbit. For every interval of 5 degrees, the number of objects librating through this longitude interval is given. For instance, an object librating between 64 deg E and 86 deg E is counted in the 5 intervals 62.5-67.5, 67.5-72.5, 72.5-77.5, 77.5-82.5 and 82.5-87.5.

For the same reason, all the objects classified as librating around the Eastern stable point or around the 2 stable points are counted in the interval 72.5-77.5, because they all go through the longitude 75 deg E. Thus, the number of objects at 75 deg E shown in this figure is equal to the sum of the objects in the L1 and L3 categories.

7 Summary

All geostationary or near-geostationary objects catalogued in ESA's DISCOS Database (Database and Information System Characterising Objects in Space) are listed in this document. An object is considered as geostationary or near-geostationary if it meets the following criteria:

- eccentricity smaller than 0.2
- mean motion between 0.9 and 1.1 revolution per sidereal day, corresponding to a semi-major axis between 42164 - 2500 km and 42164 + 3150 km.
- inclination lower than 30 degrees

1039 objects met these criteria as of 31 December 2010. 235 more objects are also known to be in this orbital region. For 163 of them KIAM provided orbital elements; 157 objects can be correlated with a launch and 6 are tracked objects that cannot be correlated with a launch. Thus, the total number of known objects in the geostationary region is 1274.

They can be classified as follows:

- 397 are controlled (268 under longitude and inclination control),
- 622 are in a drift orbit,
- 172 are in a libration orbit,
- 6 are uncontrolled with no recent orbital elements available,
- 66 are uncatalogued objects which can, however, be associated with a launch,
- 11 could not be classified.

Compared with the past issue of February 2010 the following changes can be observed: There were 32 new objects (28 payloads and 4 rocket bodies) launched into or near GEO in 2010, and also one payload launched in 2009 was added.

At least 16 spacecraft reached end of life as far as can be inferred from the orbital elements stored in DISCOS or declared by spacecraft operators. Only 11 were reorbited more than 250 km above GEO and complied with the IADC reorbiting guidelines:

- TDRS-1 (83026B, USA, 357 km x 515 km)
- Satcom C-3 (92060B, USA, 826 km x 1056 km)
- Thaicom 1 (93078B, Thailand, 302 km x 317 km)
- Brazilsat B1 (94049A, Brazil, 282 km x 298 km)
- PAS 4 (95040A, USA, 803 km x 1011 km)
- Nahuel 1A (97002B, Argentina, 241 km x 265 km)
- BSAT-1A (97016B, Japan, 309 km x 345 km)
- Intelsat VIII F-2 (97031A, Intelsat, 500 km x 738 km)
- Eutelsat W2 (98056A, Eutelsat, 281 km x 294 km)
- Insat 4CR (07037A, India, 275 km x 299 km)
- Rascom QAF 1 (07063A, Mauritius, 313 km x 372 km)

Nahuel 1A was reorbited so that it will marginally touch the 200-km protected zone around GEO in a long-term forecast.

Four spacecraft were reorbited too low:

- Thaicom 2 (94065B, Thailand, 192 km x 198 km)
- Galaxy 9 (96033A, USA, 178 km x 242 km)
- Insat 2E (99016A, India, 147 km x 205 km)
- Yamal-100 No.2 (99047B, Russia, 71 km x 95 km)

At least 1 spacecraft seems to be abandoned and has started librating around the libration point L1:

- Turksat 3 (96040B, Turkey)

The status of Cosmos-2240 (08033A, Russia) is indeterminate, as it is in an L1-type orbit, but it is not passive.

Currently, Beidou DW2 (Compass G2) (09018A, China) is in an L1-type orbit, but is unclear whether it has reached end-of-life.

Galaxy 15 suffered a malfunction and temporarily entered into a libration orbit around L2. By the end of 2010 the operators were able to bring the satellite under full control again.

This analysis has shown that in 2010, thirteen years after the IADC guidelines were established, there are still many satellites that were not or could not be properly reorbited.

One rocket body was left in a drift orbit violating the IADC guidelines (Delta 4 second stage, 10063B, USA) with the perigee 1932 km below and the apogee 111 km below GEO.
